

To whom it may concern,

Wilson Farms began using Primrose Power Master #405-C in 2016. We found that our equipment began burning over a gallon less fuel per hour per unit while showing more power. It has also tripled the life of our fuel filters. In the winter we switch to Winter Power #4033.

We then began using #357 Magnum grease. We love it. It shows less wear and less grease consumption, eliminated squeeks and has excellent water resistance and has sold us.

After purchasing a new John Deere planter, we noticed that the hydraulics were running very hot and with excessive foaming. We applied Primrose #532-T Seal Saver Hydraulic Supplement and immediately saw a 15 to 18 degree drop in operating temperatures and there was no foam. It's a real good product.

We've found #548 Chain & Cable to be an excellent lubricant that we use for several applications. No dust accumulation on the combine chains.

By adding #480-M Ultragard Oil Supplement to our bulk engine oil, we've seen cooler operating temps with better compression and less oil consumption. We also use #512-M XHP Gear Oil .

Primrose products have been a great asset to our operation.
